#709 - 837 West Hastings Street, Vancouver, British Columbia, V6C 3N6, Canada  
-----

(Address of principal executive offices)

Indicate by check mark whether the registrant files or will file annual reports  
under cover of Form 20-F or Form 40-F: FORM 20-F  FORM 40-F

Indicate by check mark if the registrant is submitting the Form 6-K in paper as  
permitted by Regulation S-T Rule 101(b)(1): \_\_\_\_\_

Indicate by check mark if the registrant is submitting the Form 6-K in paper as  
permitted by Regulation S-T Rule 101(b)(7): \_\_\_\_\_

Indicate by check mark whether the registrant by furnishing the information  
contained in this Form, is also thereby furnishing the information to the  
Commission pursuant to Rule 12g3-2(b) under the Securities Exchange Act of 1934.  
YES  NO

If "Yes" is marked, indicate below the file number assigned to the registrant in  
connection with Rule 12g3-2(b): 82-\_\_\_\_\_

SIGNATURES

Pursuant to the requirements of the Securities Exchange Act of 1934, the  
registrant has duly caused this report to be signed on its behalf of the  
undersigned, thereunto duly authorized.

NEWS RELEASE - SEPTEMBER 29, 2005

### NEW DRILLING ALONG IMA'S NAVIDAD TREND INTERSECTS UP TO 21M OF 545 G/T SILVER OUTSIDE KNOWN RESOURCES

IMA EXPLORATION INC. (IMR-AMEX, IMR-TSX.V) is pleased to report results from the Phase III drill program at it's 100% owned Navidad project in Patagonia, Argentina. Drilling has focused on expanding resources in the Connector, Navidad Hill, and Calcite Hill zones as well as exploring the newly discovered Calcite NW extension area. In addition, the company reports that five drill holes have been completed at Loma de la Plata where previously announced surface sampling has returned values of up to 40m of 740 g/t silver and 56m of 452 g/t silver. Results from the Loma de la Plata drilling will be released as soon as they become available.

At Calcite Hill, ten new drill holes have been completed, seven of which were drilled outside of the previously estimated resource (see June 16, 2005 news release). This drilling has defined an important new area of silver mineralization to the northeast of previous drilling and resources (see attached map). Highlights of these results include 27m of 407 g/t silver in hole 207 and 21m of 545 g/t silver in hole 209. This zone remains open further to the northeast. Four additional holes were drilled based on the results of 207 and 209, but are not yet available.

Six new holes were completed along the southwest flank of Navidad Hill outside of the current Indicated Resource. Five of the six holes had significant intercepts (see table). The best results in this area were returned from hole 220 which returned 27m of 80 g/t silver including 3.2m of 389 g/t silver. This mineralization remains open to expansion down-dip to the southeast.

Ten new drill holes were collared at the Connector Zone with the goal of providing the additional drill density required to upgrade the previously defined Inferred Resources to the Indicated category. Drilling here was successful in defining long intervals of moderate-grade silver mineralization with rare high-grade structures (e.g. 2m of 2,171 g/t silver in hole 234). Important intercepts include 26m of 104 g/t silver in hole 230, 37m of 107 g/t silver in hole 231, 21m of 237 g/t silver in 234, and 32m of 110 g/t silver in hole 237. Much of this mineralization starts at or very near surface.

Nine widely spaced holes were collared at the newly-discovered Calcite NW Extension and cover a strike length of 950m within the 1.2 kilometre long zone (see attached map). Results include 63m of 88 g/t silver in hole 223, 23m of 92 g/t silver in hole 224 and 23m of 115 g/t silver in hole 227. These new results, coupled with previously reported results, define a central area of approximately

## Edgar Filing: IMA EXPLORATION INC - Form 6-K

400 x 150m x 5 to 60m thick (defined by drill holes 178, 179, 202, 203 and 223-227). Reconnaissance drilling elsewhere in the Calcite Northwest Extension has defined significant mineralization outside of this central block that will be followed up with additional drilling in future programs.

The Calcite Hill NW zone is proving to have good geological continuity from hole to hole and comprises a distinctive volcanic tuff-breccia and the sedimentary rocks immediately above and below it. Galena is normally visible, sometimes copper minerals can be recognized, and in rare cases native silver has been seen in the core. The host rocks are often strongly clay altered. Assay values are somewhat erratic within the zone hence the range of thicknesses reported above the nominal cutoff grade. The zone is nearly flat-lying and typically starts at shallow depths of 15 to 50m below surface.
